

# Coral Reef Conservation and Restoration: Our Last Chance to Save the Ocean's Rainforests

They provide food and shelter for a wide variety of marine life, and they play a vital role in the global carbon cycle. Coral reefs are also a major tourist attraction, generating billions of dollars in revenue each year.

However, coral reefs are under threat from a number of human activities, including climate change, pollution, and overfishing. Climate change is causing the ocean to become warmer and more acidic, which is making it difficult for corals to survive. Pollution is also a major threat to coral reefs. Sewage, agricultural runoff, and industrial chemicals can all damage coral reefs and kill coral. Overfishing is another major problem. When too many fish are removed from a reef, it can disrupt the ecosystem and make it more difficult for corals to recover from other threats.

As a result of these threats, coral reefs are declining around the world. In some areas, coral reefs have already been lost entirely. If we do not take action to protect and restore coral reefs, we will lose one of the most important and beautiful ecosystems on Earth.
